

Effective Distraction for Needle Poke Apprehension and Anxiety

ShotBlocker®

ShotBlocker uses the distraction technique to hide the pain of the needle poke. A novel application of the Gate Theory of Pain Management, ShotBlocker uses a number of blunt contact points to saturate the sensory signals around an injection site.

A simple, non-invasive device that distracts patients from needle poke pain signals.

“This thing is amazing. Normally shots end in 20 minutes of hysterics, but our pediatrician used it during shots this year and our 5 year old barely felt it! I am buying one to bring to our next pediatrician appointment.”
